Hiring Manager
Apple IS&T
Apple Inc.

Re: Software Engineer — Apple IS&T

Dear Hiring Manager,

I've spent the last four-plus years working on systems where downtime is genuinely not an option — financial platforms processing millions in transactions, healthcare data pipelines running around the clock. That kind of environment shapes how you think about software. When I saw this role on Apple's IS&T team, it felt like a natural next step.

Currently at Infosys, I work on a microservices platform built with **Java** and **Spring Boot**. One of the more involved things I've shipped is an SFTP-to-Azure data pipeline that handles around 10,000 EDI 834 files a day. Getting that to run reliably without manual intervention took a fair amount of iteration — mostly around error recovery and making sure concurrent jobs didn't step on each other. I also do code and design reviews regularly, and have been mentoring a few junior engineers on the team, which I find I actually enjoy.

Before that, I was at FIS Solutions working on a Wealth Management platform that processed SWIFT messages for several global banking clients. The codebase was old and the requirements were strict — compliance updates couldn't break anything already in production. It taught me to be careful and deliberate, especially when touching shared infrastructure.

What draws me to this role specifically is the scale. Writing software that works at Apple volumes is a different problem than what most teams deal with, and I want to work on problems at that level. I'm comfortable picking up new domains, working across teams, and figuring things out without a lot of hand-holding.

Happy to chat more if you think there's a fit. Thanks for your time.

Sincerely,

Anchit Bhushan
